

## HYBRID SOLUTION

### One control unit, three software versions

Switch between GEJOScan, INSPECTOR or K2000 on the spot, as required, at the push of a button.

As a user of our technical system, you can perform a wide range of different tasks:

In the course of your day-to-day work you may sometimes just need a camera briefly to perform a visual inspection to take a few photos for an individual customer, but sometimes you may need to carry out a complex camera inspection in accordance with standards for an engineering office or a local council.

You need to be flexible in the course of your work – and your equipment needs to be just as flexible:

In addition to the familiar PELI control unit technology, our new touch control unit has a powerful Windows PC inside, which allows you to switch between different software applications.

This means that you always have both the basic GEJOScan software and an even more detailed, 3D history-capable special application (INSPECTOR or K2000) available to you, without the need for a second inspection system or a second control unit.

This allows you to decide which inspection software you want to use for each application at the push of a button – from free-text data acquisition to the standard-compliant 3D data capture of a complicated pipe route. Everything is possible with the new BurrowTech hybrid system!

- New: work on dual screens – just like in a professional inspection van
- Separate display of camera image and operating panel/software screens – at a convenient size
